I would like to build a robot that can teach children school work and have fun with children after children get out of school everyday. Nowadays, as time goes by, parents are busy with life in Asia so that grandparents have to help the parents take care of their grandkids, which human can get tired and grandparents do not understand the grandkids school assignments. My robot will teach children math, science, or any other subjects and play some games that can trigger kids to computationally and logical think when parents are busy and grandparents aren't capable of doing. Such a robot will help parents to make kids smarter, win at beginning of every semester, and still have family time when parents are off work on Sundays. A key risk is that such a robot might cost a lot and need to frequently update the version for the robot but it might get children to have better future paths and environments. I will try to ask some questions to the robot and make the robot play some games with me in the first place as well as making sure the robot won't hurt human.
